

Load Balancer

Load balancing is critical for application availability and resiliency, yet existing solutions have been outpaced by advancements in infrastructure and service architecture.

Granular control over routing decisions

- ✓ Smarter and Optimized Routing Decisions
- ✓ Real-Time Configurability
- ✓ Scalability at Global Levels

With Fastly Load Balancer, you can distribute requests across multiple origin servers for improved reliability, scalability, and performance. It offers content-aware routing, highly configurable server management, and the ability to act as a global or local server load balancer, making it an ideal solution for modern, dynamic applications.

Smarter and Optimized Routing Decisions

Route traffic efficiently using smarter routing rules.

Real-Time Configurability

Configure your servers in real time for maximum performance and uptime.

Scalability at Global Levels

Seamlessly scale large traffic loads without interruptions or delays.
