

Object Storage

It works just like the storage you're used to today, but without costly egress fees. S3-compatibility gives you direct access to all of your data at the edge in a familiar footprint that works with existing code.

Zero egress, S3-compatible

- ✓ Say goodbye to cloud storage egress
- ✓ S3-compatible API
- ✓ Predictable pricing

All the storage your apps could ever need

How it works

Fastly Object Storage is designed as a drop-in replacement for any S3-compatible storage solution. This means you can store and access large files from Fastly services using the same interface you're already familiar with.

On-Demand Migration lets you migrate only your active "working set" dramatically reducing egress fees from your previous provider and ensuring you only pay to store what your users actually need.

Best of all? You get zero-egress access to Object Storage from both our Compute and Content Delivery services. Startups to large enterprises benefit from the cost optimizations realized with Fastly Object Storage.

*"Fastly is helping us move our data faster, and has given us the confidence that our content will be available with low latency, high performance, and repeatable, reproducible configurations. Our storage costs are down **\$100K** per month."*

-Director, Cloud Infrastructure

(Leading provider of digital media assets)

Use Fastly Object Storage for:

- **Media libraries:** Your multi-terabyte to petabyte media library means that multi-terabyte to petabyte egress fees can be eliminated as you pull data into the Fastly network.
- **AI training data sets:** Use Fastly Object Storage to help you organize and retrieve large volumes of unstructured AI training data at scale during model development.
- **Application content:** Store and serve images, static assets, app output, user-generated content, and more.
