

# Certificate Management

Remove typical barriers when it comes to TLS setup and management to deliver secure and private experiences.

## Reduce the complexity of TLS management

- ✓ Flexibility and Control
- ✓ Simplified Management
- ✓ Performance and Scale

Beyond the trust, security, and privacy TLS provides, it can also have positive (or negative) impacts on business performance. Browsers prominently display when connections are secure, provide warnings for domains without TLS, and there can be serious consequences to SEO performance.

But, certificates are often hard to manage, meaning valuable resources need to dedicate time to managing them and errors can result in downtime if a certificate expires or is compromised.

Our portfolio of TLS offerings allows every organization to deliver secure and private experiences to their end users — whether you just want to turn on TLS for a single domain or have detailed and complex security requirements.

### Flexibility and Control

With options to use our TLS certificates or bring your own, you gain full control over your certs via our UI, API, or white-glove service.

### Simplified Management

Frictionless setup and management enables you to focus on building great websites or applications — rather than wasting cycles configuring TLS.

### Performance and Scale

Fastly provides worldwide TLS termination with powerful edge servers, reducing the round trip times and the total performance costs.
